

This application note describes the comprehensive PMBus™ digital communications feature-set for the Murata AC-DC front end power supply modules listed below. For additional details, refer to the corresponding datasheet.

MPS #	Model Number	Address	Main Output	Standby Output	Airflow
M1975	D1U54T-W-1200-12-HB3AC	ADDR_SEL (External resistor)	12Vdc	12Vdc	Front to Back
M2045	D1U54T-W-1200-12-HB4TAC			12Vdc	Back to Front
M2046	D1U54T-W-1200-12-HU3AC			3.3Vdc/5Vdc	Front to Back
M2047	D1U54T-W-1200-12-HU4TAC			3.3Vdc/5Vdc	Back to Front

Standard PMBus™

The following general statements apply:

- All data communicated over the PMBus™ interface uses PEC (Packet Error Checking) as defined by the standard for PMBus™ Power Systems Management Protocol Part 1 – General Requirements Rev 1.2.
To correctly execute the “write” operation (and avoid setting CML errors) the PEC protocol must be enabled in the host system.
- Linear data formatting is used for all passed parameters; direct data formatting is not supported.
- Block reads (where the first byte received denotes the remaining bytes to be clocked out) are supported on this product.
- A minimum of 300µs delay between transactions (between the STOP of one command and the START of the next command) is recommended for robust communications.
- Up to 400KHz I²C communications is supported for the PMBus™ interface.
- The PMBus™ slave controller does “clock stretch” on ACK or NAK.
- At initial power up (from application of the AC/DC source) The host/system should wait for assertion of the PW_OK signal before commencing communications with power supply module.
- STATUS_X register bits and associated hardware signal are “sticky” and require “CLEAR_FAULTS” write command or power recycle to clear, even after the imposing fault stimulus has been removed.

Device Addressing:

The power supply module contains two internal slave devices (a secondary side microcontroller + external EEPROM), and are accessible to host/system via the PMBus. The following addresses can be assigned to the internal slave devices by placing a pulldown resistor “Rn” from the power module’s “ADDR” Pin to output return.

SLAVE DEVICE SERIAL ADDRESS SELECTION OPTIONS		
Microcontroller	External EEPROM	Rn (ohm)
0xB0	0xA0	820
0xB2	0xA2	2700
0xB4	0xA4	5600
0xB6	0xA6	8200
0xB8	0xA8	15000
0xBA	0xAA	27000
0xBC	0xAC	56000
0xBE	0xAE	180000

Note: Leaving the “ADDR” pin unterminated will result in default address BE/AE being assigned Resistor tolerance +/-5% or better

PMBus™ Command List:

CMD CODE	COMMAND NAME	READ / WRITE	PG.	FORMAT	# OF BYTES	BIT#	BIT NAME	DEFINITION	Support Y/N
00	PAGE	R/W	All		1			Command to provide ability to configure, control & monitor multiple outputs	YES
01	OPERATION	R/W	All	Bit Flags	1	5:0		Set output margin high/low voltages	NO
						7:6		Turn the unit on/off in conjunction with digital input from PSON_H	YES
02	ON_OFF_CONFIG	Send	All	Bit Flags	1	0	ON_OFF_DELAY	Set when Turn off immediately (default) / 0 = Use delay @ turn-off	YES
						1	ON_OFF_POLARITY	Set when Power on processing is active high (default)	YES
						2	USE_CONTROL	Set when Use CONTROL pin for on/off power processing (default)	YES
						3	USE_OPERATION	Set when Use OPERATION command for on/off power processing (default)	YES
						4	USE_CNTL_AND_OP	Set when Use both CONTROL pin & OPERATION command (default)	YES
						5	RESERVED		NO

						7	RESERVED		NO
03	CLEAR_FAULTS	W	All		0			Write only command clears all faults that have been set in all the STATUS_XXXX registers simultaneously	YES
04	PHASE	R/W	All		1			Command to provide the ability to configure, control, and monitor multiple phases on one PMBus unit.	NO
05	PAGE_PLUS_WRITE	Block Write	All		Variable			Command used to set the page within a device, send a command, and send the data for the command in one packet	YES
06	PAGE_PLUS_READ	Block Write / Block Read Process Call	All		Variable			Command used to set the page within a device, send a command, and read the data returned by the command in one packet	YES
10	WRITE_PROTECT	R/W	All		1			Command to provide ability to configure, control & monitor multiple outputs	YES
11	STORE_DEFAULT_ALL	Send	All		0			Command instructs PMBus device to copy contents of Operating Memory to matching NVM	NO
12	RESTORE_DEFAULT_ALL	Send	All		0			Command instructs PMBus device to copy contents of NVM to matching Operating Memory	NO
13	STORE_DEFAULT_CODE	W	All		1			Command instructs the PMBus device to copy the parameter whose Command Code matches value in the data byte, from Operating Memory to matching NVM	NO
14	RESTORE_DEFAULT_CODE	W	All		1			Command instructs the PMBus device to copy the parameter whose Command Code matches value in the data byte, from NVM to matching Operating Memory	NO
15	STORE_USER_ALL	Send	All		0			Command instructs the PMBus device to copy the entire contents of Operating Memory to matching NVM	NO
16	RESTORE_USER_ALL	Send	All		0			Command instructs the PMBus device to copy the entire contents of NVM to matching Operating Memory	NO
17	STORE_USER_CODE	W	All		1			Command instructs the PMBus device to copy the parameter whose Command Code matches value in the data byte from Operating Memory to matching NVM User Store memory	NO
18	RESTORE_USER_CODE	W	All		1			Command instructs the PMBus device to copy the parameter whose Command Code matches value in the data byte from NVM to matching Operating memory Store memory	NO

Manufacturers Internal FRU Data (PMBus Inventory Information Registers)

These results are variable length and presented in block format, where the first byte represents the QTY of bytes and the remaining bytes represent the text character in ACSII format. The data varies with model and unit to unit (includes serial number data).

The following tables detail the returned results that can be expected for the FRU values.

Cold Redundancy (“Rapid_ON”) Configuration Bytes

This section describes the configuration and operating details of the cold redundant features of this power module. ACAN-112 contains further details about the Rapid_On signal configuration.

URL Link to [ACAN-112](#)

This series can be operated in one of two cold-redundant modes:

1) Automatic Mode CR (INTEL CRPS Compliant):

0x0h = conventional redundancy
0x1h = Master & Active PSU
0x2h = Cold_redundant_Level_1
0x3h = Cold_redundant_Level_2
0x4h = Cold_redundant_Level_3

2) Manual

Roll Names:

CONVENTIONAL REDUNDANCY: (BYTE 0x0h) = DEFAULT SETTING

COLD_REDUNDANCY_FORCED_ACTIVE: (byte 0x55h) At least one (1) PSU must be assigned this roll, aka “Always On” (subsequent PSUs assigned this same roll will be known as “ACTIVE & SLAVE” and the first PSU Assigned the roll of “55” provides the bus pull-up)

COLD_REDUNDANCY_FORCED_STANDBY_X: (byte 0xEh) System makes the PSU output on/off decision and write either “55h” or “Eh” as system requires. Up to 8 PSUs can be controlled in this mode.

NOTE: If the MASTER & ACTIVE PSU to a is written to mode “0x0” by host/system, the CR bus will be forced low and all connected PSUs will end CR mode and immediately share conventionally, while COLD_STANDBY_x assigned PSUs simply enter conventional current share and do not pull down the CR bus.

FAN COMMAND: 0X3B (FAN_COMMAND_1) [Link Back to Commands List: CMD_3B](#)

Manual fan speed control via PMBus™ is a linear data mode two byte command, speed expressed as fan duty cycle. This table below contains the manual fan speed command data in 1% increments, for illustration purposes.

The power supply automatically cancels manual fan speed control and enters automatic fan speed control by any of the following conditions or methods:

- 1) Writing the command "03h"(CLEAR_FAULTS).
- 2) Any overtemperature fault or warning (manual fan speed control mode can be resumed after the faults and warnings have ended)
- 3) Recycling of AC input voltage
- 4) Toggling PS_ON signal
- 5) Issuing a fan command that is outside the normal maximum limits, i.e., writing a fan speed of 110% duty cycle.

Linear Data Format

Telemetry sensor and output voltage readings follow linear format as defined by PMBus Power System Mgt Protocol Specification – Part II – Revision 1.2 (summarized below)

The Relationship between Y, N and the “real world” value is:

$$X = Y \cdot 2^N$$

Where, as described above:

X is the “real world” value;

Y is an 11 bit, two's compliment integer; and

N is a 5 bit, two's compliment integer.
